

FS-60CB Introduction

Modification of FS-60C and New Reducer-C 0.72X

New Reducer for FS-60C will be introduced

To install the new Reducer, FS-60C is modified

Modifications:

1. Mechanical tube length: 18mm shorter than FS-60C
(On the current FS-60C, if the camera angle adjuster is fixed, the focusing becomes impossible.
2. Instead of shorter tube, the draw tube extension 18mm is added.
3. Draw tube stop ring inside diameter becomes large. (same as FCT-65)
4. Delete the inside tube diaphragm, the tube inside is less shiny painted.

The Reducer-C 0.72x can be used with current FS-60C, but it is inconvenient as follows.

1. The camera angle adjuster cannot be used (to focus), but the reducer should be attached directly to the draw tube. In this case, to rotate the camera, the main tube must be rotated or the camera must be rotated at the wide ring. Both way is inconvenient.
2. Because of narrow draw tube stop ring, the light on the edge field becomes short.

The modification parts (short tube, draw tube stop ring & draw tube extension) shall be introduced into the market in future in order to change the FS-60C to FS-60CB type to use the Reducer C-0.72X. But in this case, the serial number is necessary because in the past, there were several types.
